

Process Development Strategy

Overview

Client producing powdered carbon required insight and recommendations regarding beading technologies for their product.

Objectives

- Evaluate the suitability of client's carbon for various types of beading / densification processes and recommend forward strategy.

Recommendations

The client's data was assessed relative to requirements and an action plan was generated based on the absence of key carbon characteristics. A plan and indicative costs were given based on different process scenarios, depending on the outcome of measurements of key carbon characteristics.

Outcome

The client initiated a plan to cover the key characteristics and was able to develop alternative business plans and budgets based on the scenarios.
